

Roulette Payoffs

ROULETTE PAYOUTS

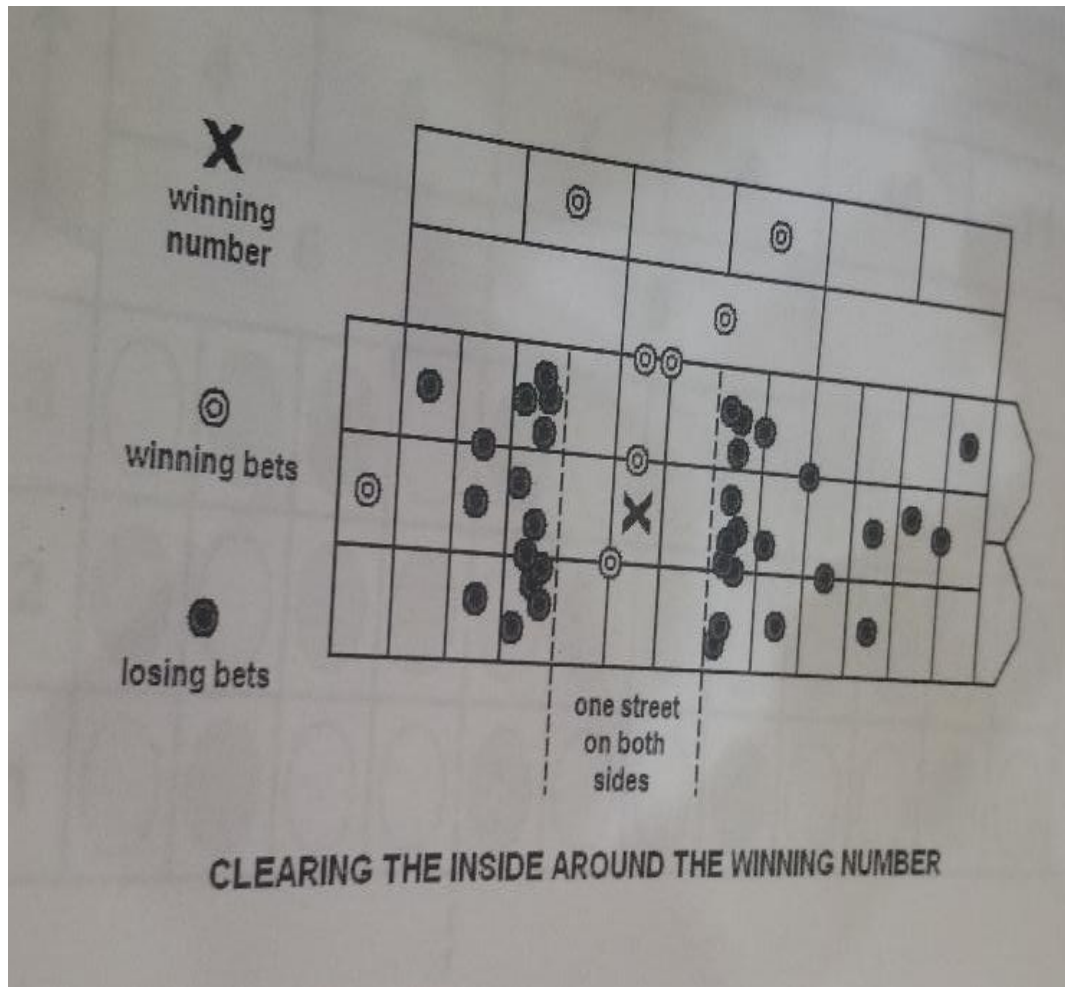

The diagram shows a standard roulette table layout. The main grid contains numbers 1 through 36, with 0 and 00 at the top. Betting areas are labeled with letters A through K, corresponding to the table below.

OUTSIDE BETS			
A	EVEN CHANCE	pays	1 to 1
B	DOZEN	pays	2 to 1
C	COLUMN	pays	2 to 1

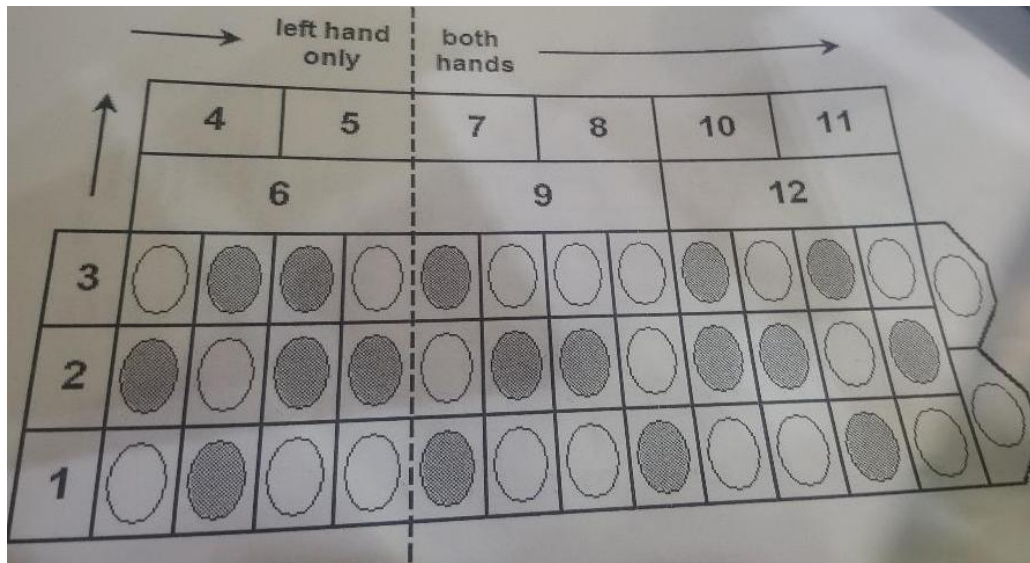

INSIDE BETS			
D	STRAIGHT UP	pays	35
E	SPLIT	pays	17
F	STREET	pays	11
G	3 NUMBER	pays	11
H	CORNER	pays	8
I	LINE	pays	5
J	TOP LINE	pays	6
K	COURTESY LINE (0-00)	pays	17

Paying process

Clear by the winning number

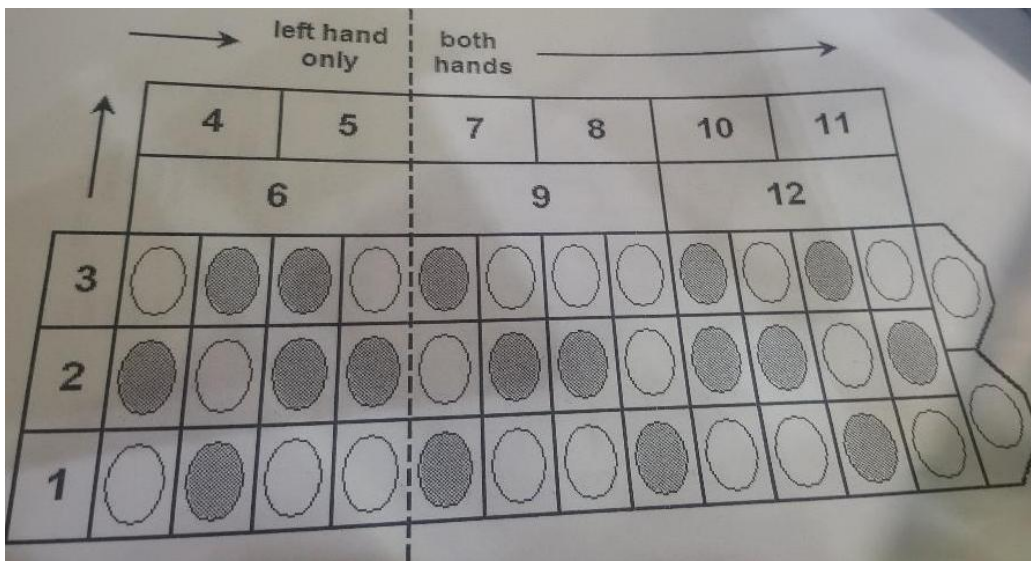

Clear the outside

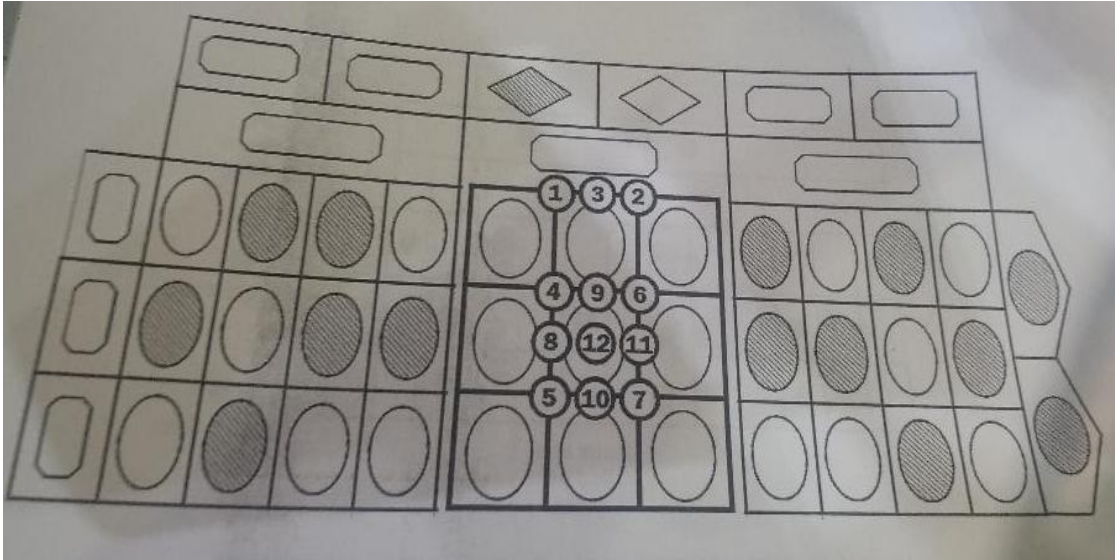

1. First picking up the losing bets in the columns, starting with the columns with the numbers 3 to 36, then 2 to 35 and finally 1 to 34.
2. Second picking up the outside losing bets as shown in the above diagram
3. Finally clear the inside board of any losing bets.

Paying the bets

Pay the outside bets

Pay the outside bets in the same order that you picked up the losing bets, starting with column closest to you,

2. The

players cannot collect these until you are finished paying the inside winning bets.

Paying the Inside number

Inside paying order

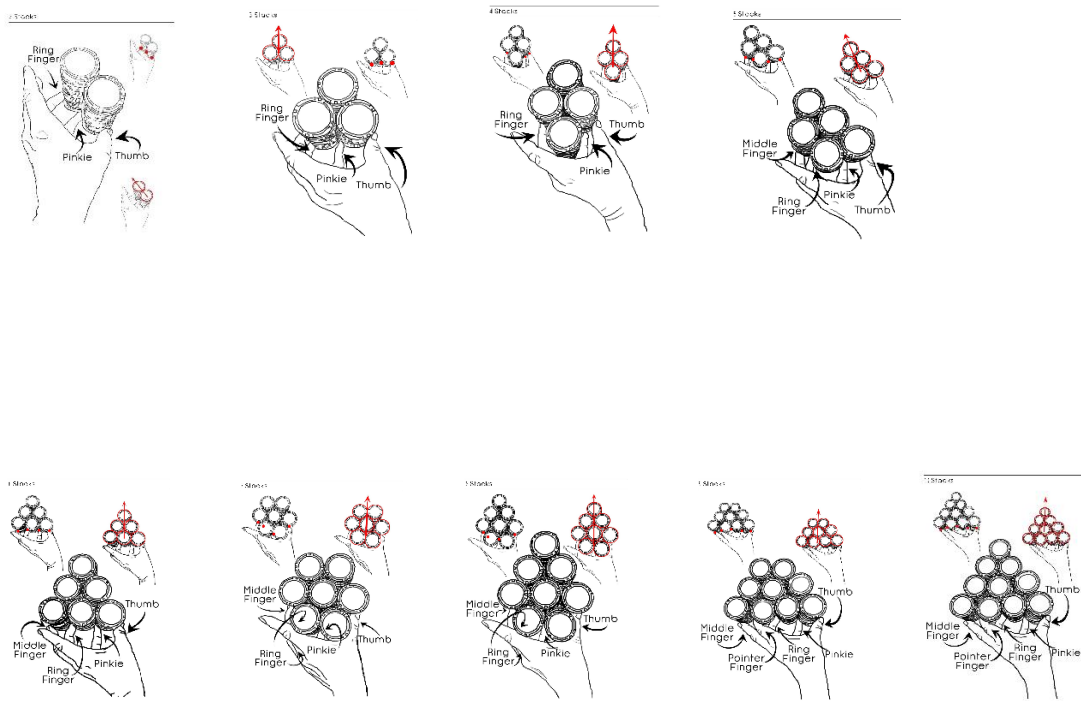

1. Bets will be paid according the above diagram.
2. Different colors should be offset from each so, the dealer, customer, supervisor and surveillance can clearly ensure the proper payoff.

3. Pay bets from the top down, in the above picture, pay the white than the purple, than the blue.
4. Colors with over 5 chips, should be offset `in 5's, if over 20, then offset in 20.

Stacks and pushing:

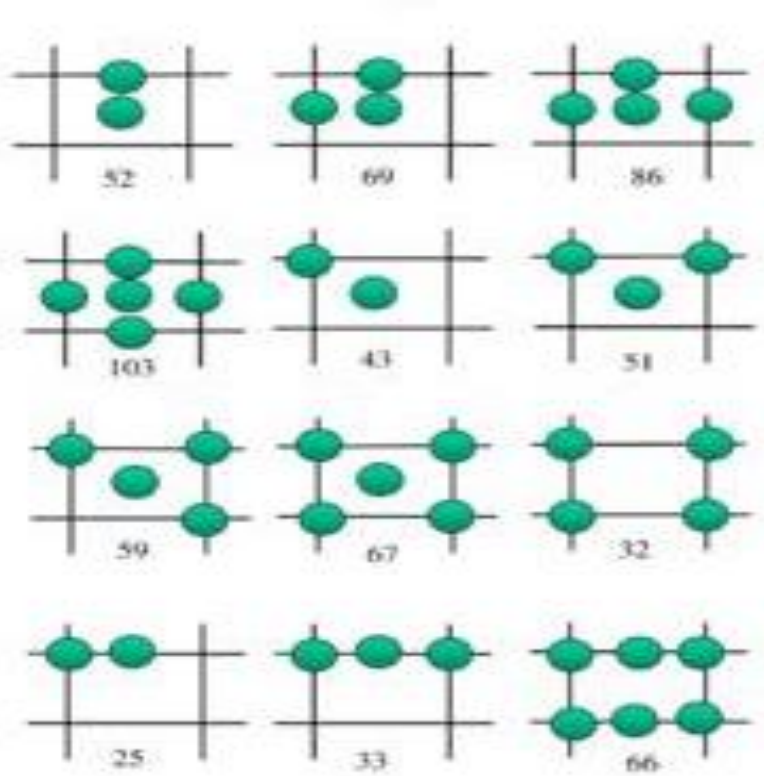

How to spin the ball:

Picture Bets:

Roulette conversion short cuts:

Nickels- cut the payoff in half and add a zero.

I.e, 82 is the payoff, cut in half 41 add a zero 410. The conversion in nickels payoff is 410.

I.e. 126 is the payoff, cut in half 63 add a zero 630. The conversion in nickels payoff is 630.

Quarters conversion-

Straight ups- for every straight up quarter add 900 then subtract the actual value of quarters on the straight up bet.

i.e. 2 straight up , $2 \times 900 = 1800$, minus 50 = 1750.

i.e 3 straight up qtrs., $3 \times 900 = 2700$ minus 75 = 2625

splits- for every split times 400 and then add the qtr value on the bet.

i.e. 4 splits, $4 \times 400 = 1600 + 100 = 1700$.

I,e 3 split, $3 \times 400 = 1200 + 75 = 1275$.

Total bet- divide the amount by 4 and add two zeroes at the end.

I.e. 44 qtrs, $44/4 = 11$ add 2 oo's , 1100.

i.e. 24 qtrs, $24/4 = 6$ add 00;s , 600.

Odd amount divide 4 to nearest whole dollar then add the qtr value left over to the total.

i.e. 34, $32/4 = 8$ the 800, plus 2 qtrs, 850.

Straight Ups pay 35:1

Number of straight up chips divided by 2 x 7. Example $16/2 = 8 \times 7 = 56$. When dealing with larger numbers using this key, you would add a zero to the end of the number. Correct answer is 560. Whenever you have an odd number of straight ups, either round it up or down 1 number to make it even and use the key again. Remembering to add or subtract 35 from the total, to accommodate for rounding up or down 1 to make the number even.

EVEN NUMBER OF STRAIGHT UPS AND SPLITS;

Example, 4 straight up and 4
Splits

Divide the straight up bet in half – 2, add 2 zero

Then add both bets together – 8

The bet pays 208

Another example ; 8 straight up and 8 splits

Divide the straight up bet in half - 4

Add both bets together - 16

The bet pays – 416

Splits

Blackjack the bet, add a zero, add double the stack to it.

14 splits

14 blacked jacked 21 , then 210 plus 28= 238

On odd amounts divide by nearest even then blackjack the bet, add a zero, add double the stack to it. Then add the leftover 17 to that.

Split and corner

Together they equal 25

Divide number of splits and corners by 4 and add 2 0's.

i.e. 12 splits and 12 corners

$12/4=3$ then 300.

If odd amount then divide by the nearest even number then Divide number of splits and corners by 4 and add 2 0's. then add the leftover (split corner to that) 25 to that.

i.e. 13 splits and 13 corners

$12/4=3$, then 300. Plus 25=325

1 Straight up and 1 split

Together they add up to 52

Divided the amount of chips in the straight stack in half, add 2 zero's then add the total number of chips.

i.e. 6 straight ups and 6 splits

$6/2= 3$, add to zeros' to 3= 300, plus the 12 chips bet= 312

1 straight up and 2 corner's, "mickey mouse"

Together they pay 51

Dived the amount of chips in the straight stack in half, add 2 zero's then add the total number of chips, in just the straight up stack.

i.e. 6 straight ups and 12 corners

$6/2 = 3$, add to zeros' to $3 = 300$, plus the 5 chips bet = 306
