What's the Best Bet Spread?

People much smarter than you and me have determined that a bet spread between 1 and 5 units is the best way to avoid undue attention from the casino. By this reckoning, you should bet 1 unit for a +1 count, all neutral counts, and all negative counts. A +2 count means 2 units, a +3 count means 3 units, a +4 count means 4 units, and anything over +4 means you bet 5 units. Going over 5 units is likely to attract unwanted casino heat.

Using this system and perfect blackjack strategy, you can expect a positive return of about 0.14%. You're not going to get rich with small wins under this system, but it will turn a negative expectation game into a positive one.

Larger Bet Spreads

The only way to increase your expectation is to use a 1-10 unit bet spread, which is sure to get you [kicked out of any casino](#) eventually. Still, as long as you can get away with a 1-10 unit spread, you can play with an edge of about 0.57%, or about three and a half times greater than with a 1-5 unit spread.

Since casinos have implemented rules and strategies to counteract card counting, the easy to beat blackjack tables have disappeared. Casinos are now instituting a 6:5 blackjack payout rule, for instance, that automatically makes the game not worth the time it takes to count cards and develop a bet spread. Perfect blackjack strategy is often as good as you can get at today's blackjack tables, since even the most aggressive counting and bet spreading gives you only about a .5% edge.

Count is 0 = bet 1 unit

Count is 1= bet 1 unit

Count is 2= bet 2 units

Count is 3= bet 3 units

Count is 4= bet 4 units

Do this up to 10 units.

: Optimal Betting

Subtract 1 from the true count to determine how many units to bet. Multiply the number of units to bet by your betting unit.

For Example, your betting unit is 100, running count is +10, true count is +5, then the optimal bet would be 4×100 which gives us 400.

Play two hands at a time on spots next to each other, and bet that amount per hand. If you're the only player at the table, or if you can only play 1 hand, bet 25% more on one hand.
